

#### **BJT and BJT Circuit**

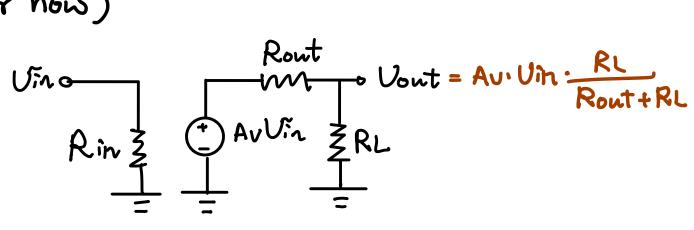

Ve311 Electronic Circuits (Summer 2020)

Dr. Chang-Ching Tu

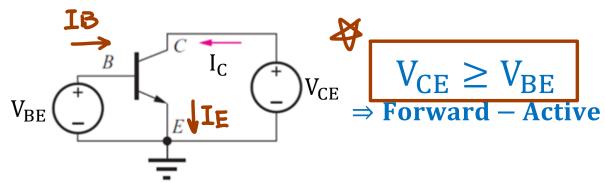

For a general amplifier model:

Generalized small-signal model: (more important in final exam, no need to understand this deeply for now)

### Summary

$$I_{C} = I_{S} \left( e^{\frac{qV_{BE}}{kT}} - 1 \right)$$

$$\alpha = \frac{I_{C}}{I_{E}} \cong 1$$

$$\alpha = \frac{I_{C}}{I_{E}} \cong \mathbf{1}$$

$$\beta = \frac{I_C}{I_R} = \frac{\alpha}{1 - \alpha}$$

 $I_S$  is a constant in the spice model.

#### Ideal case

$$I_{C} = I_{S} \left( e^{\frac{q V_{BE}}{kT}} - 1 \right)$$

$$\alpha = \frac{I_C}{I_E} = 1$$

$$\beta = \frac{I_C}{I_B} = \infty$$

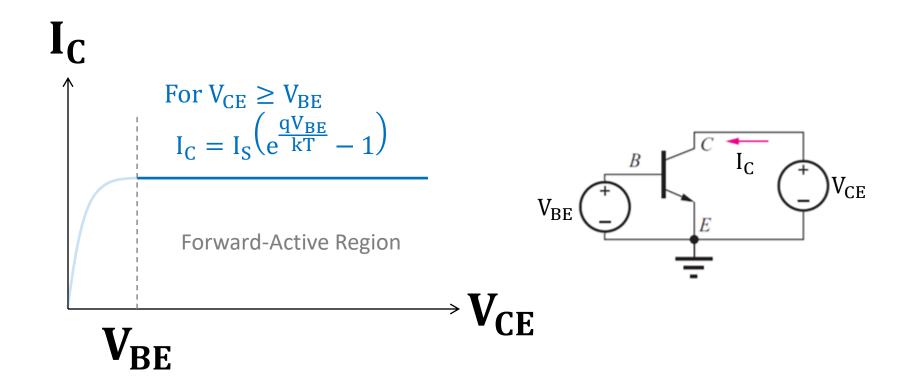

完全理想:门电压VBE-定,Ic=IE 固定 第一种非理想:门漏电

第二种非理想:随着VcE个, Ic个》Early effect 集电压对集电流有影响

 $I_C$  vs  $V_{CF}$  and  $I_C$  vs  $V_{RF}$ in Forward-Active Region

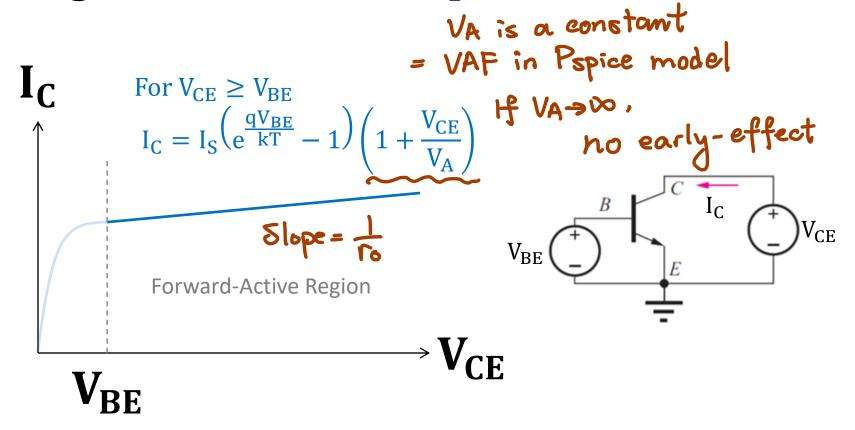

## I<sub>C</sub> vs V<sub>CE</sub> (not considering Early Effect)

## At given $V_{BE}$ , DC sweep $V_{CE}$

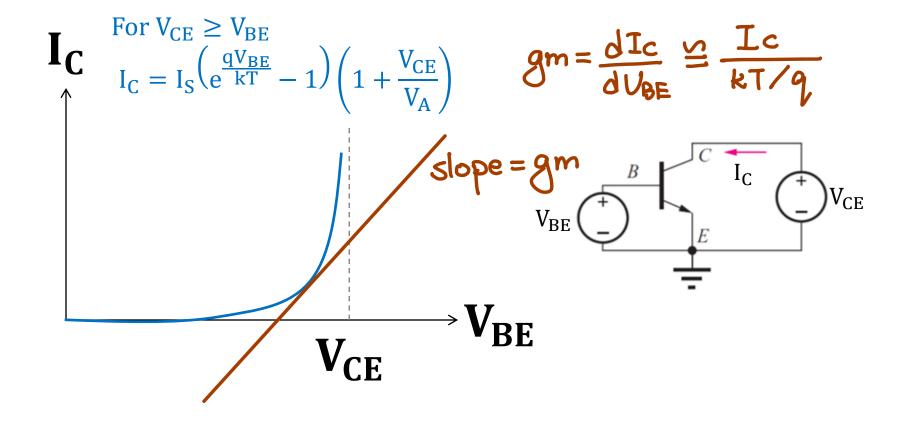

## I<sub>C</sub> vs V<sub>CE</sub> (considering Early Effect)

## At given $V_{BE}$ , DC sweep $V_{CE}$

 $V_A$  is a constant in the spice model.

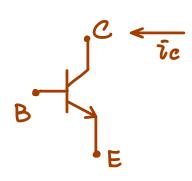

## At given $V_{CE}$ , DC sweep $V_{BE}$

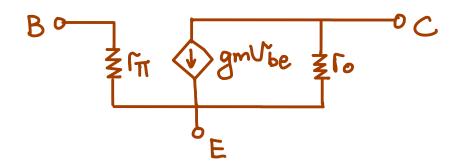

## Small-Signal Model

### Conclusion first:

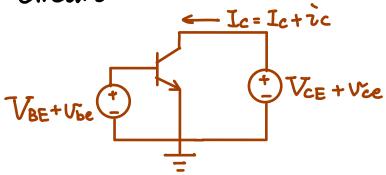

For a BJT as:

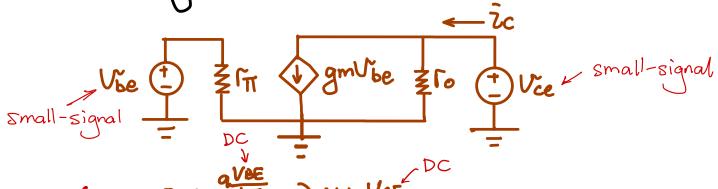

Its small signal model is:

Typical circuit:

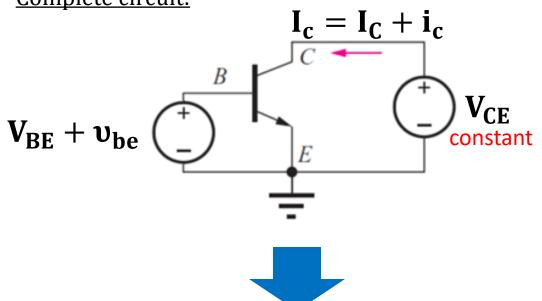

Small signal model:

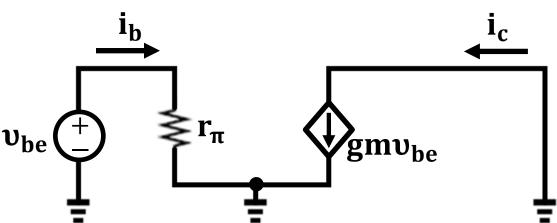

## Hybrid- $\pi$ Model (how to get gm and $r_{\pi}$ )

$$V_{CE} \ge V_{BE}$$
 $\Rightarrow$  Forward – Active

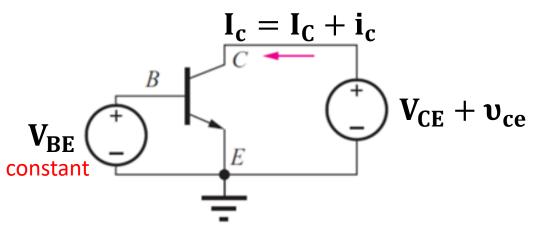

#### **Small-signal circuit:**

$$\begin{split} r_{\pi} &= \frac{dV_{BE}}{dI_B} = \frac{1}{\frac{dI_C}{\beta dV_{BE}}} = \frac{1}{\frac{gm}{\beta}} = \frac{\beta}{gm} \\ gm &= \frac{dI_C}{dV_{BE}} \cong \frac{I_C}{kT/q} \end{split}$$

### Hybrid- $\pi$ Model (how to get $r_o$ )

#### **Complete circuit:**

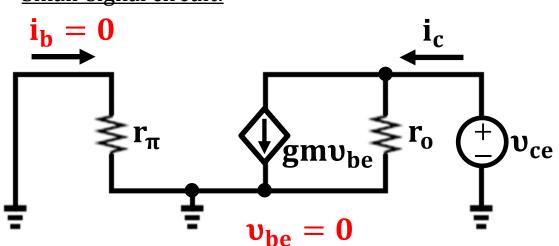

$$V_{CE} \ge V_{BE}$$
 $\Rightarrow$  Forward – Active

$$I_{C} = I_{S} \left( e^{\frac{qV_{BE}}{kT}} - 1 \right) \left( 1 + \frac{V_{CE}}{V_{A}} \right)$$

**Small-signal circuit:** 

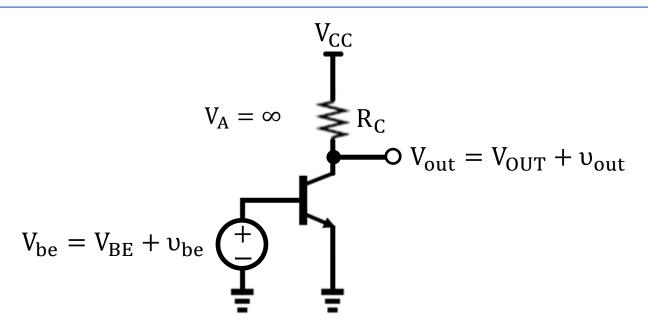

$$\begin{split} r_{\pi} &= \frac{1}{\frac{dI_B}{dV_{BE}}} = \frac{1}{\frac{dI_C}{\beta dV_{BE}}} = \frac{1}{\frac{gm}{\beta}} = \frac{\beta}{gm} \\ gm &= \frac{dI_C}{dV_{BE}} \cong \frac{I_C}{kT/q} \\ \\ r_o &= \frac{1}{dI_C} \cong \frac{V_A}{I_C} \end{split}$$

Note: Why do we have ro, M, gm in small zignal model? (Skip this page if you already understand) Ictic (+) VcE =1.5V  $I_c = I_s(e^{9\frac{V_{BE}}{kT}} - 1) (1 + \frac{V_{CE}}{V_A})$ 0.7+0.001sin(21160t) gmUbe 1 +0.0018in(21160t) So, here's a dependent current source that simulates Ubegm ic= qmUbe Since  $\beta = \frac{Ic}{TB} = 100$ y be ↑ > ic ↑ > ib ∫ " feels like " I'm exists 2 F: =1,50+0,001 sin (21760t) \( \frac{1}{2} \cdot \frac Ic A 20↑ 0 gmvbe \$10 Dice since ic = Uce VBE=0.7V "feels like" To exists here +0,001 sin (27160t)  $\frac{f_{0.001}}{F_0}$  sin (21160t)

## Common-Emitter Amplifier

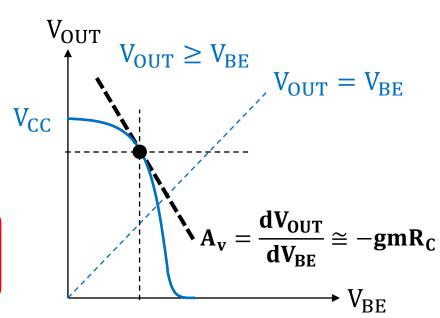

### Common-Emitter Amplifier $(V_A = \infty)$

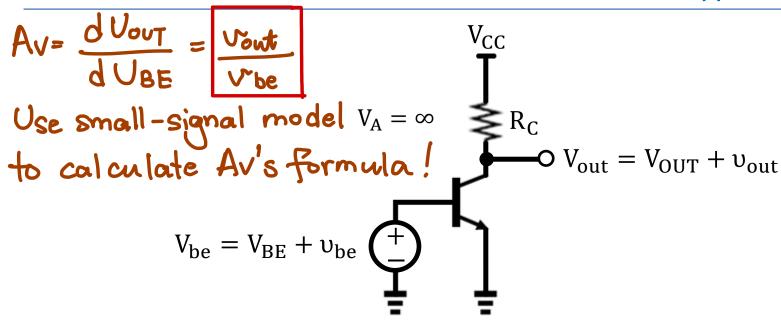

#### DC Analysis

$$\begin{aligned} V_{OUT} &= V_{CC} - I_C R_C \\ &= V_{CC} - \frac{AqD_n n_i^2}{N_a W_B} \left( e^{\frac{qV_{BE}}{kT}} - 1 \right) R_C \end{aligned}$$

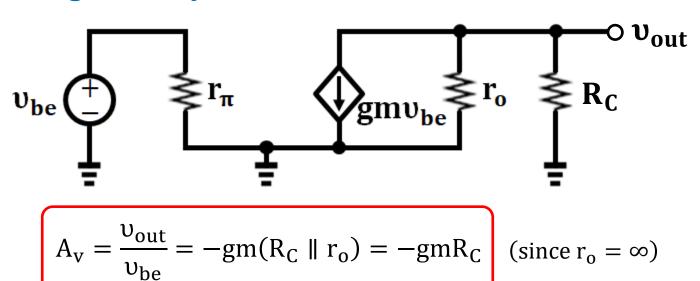

$$A_{v} = \frac{dV_{OUT}}{dV_{BE}} \cong -\frac{I_{C}}{kT/q}R_{C} = -gmR_{C}$$

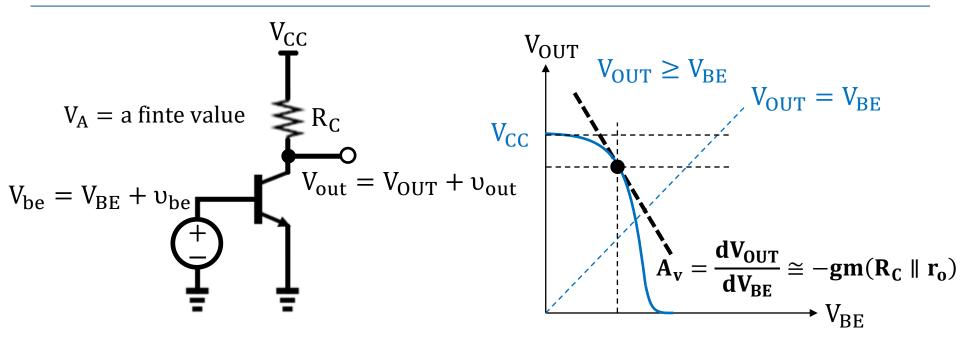

### Common-Emitter Amplifier $(V_A = \infty)$

Small-Signal Analysis

## Common-Emitter Amplifier $(V_A = a finite value)^{16}$

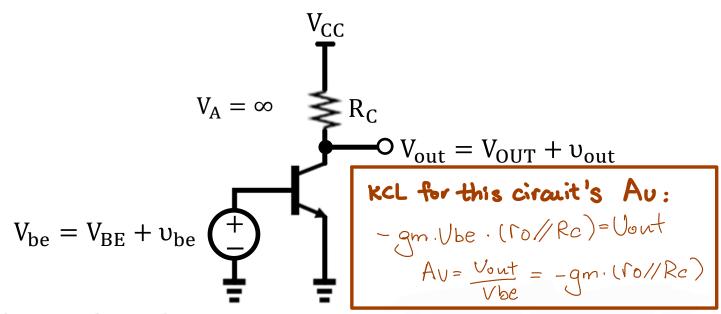

#### DC Analysis

$$V_{OUT} = V_{CC} - I_{C}R_{C} = V_{CC} - I_{S} \left( e^{\frac{qV_{BE}}{kT}} - 1 \right) \left( 1 + \frac{V_{OUT}}{V_{A}} \right) R_{C}$$

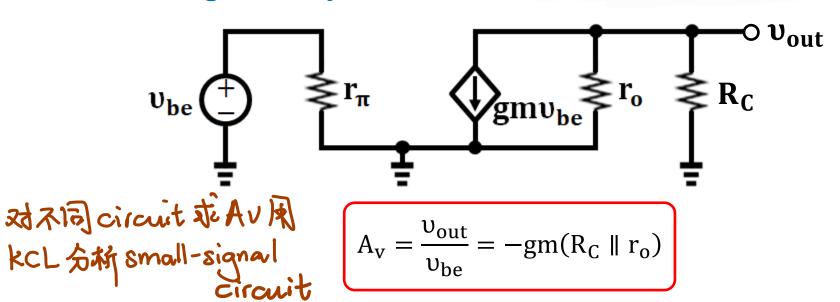

$$\frac{dV_{OUT}}{dV_{BE}} = -\frac{q}{kT} \frac{1}{I_S} e^{\frac{qV_{BE}}{kT}} \left(1 + \frac{V_{OUT}}{V_A}\right) R_C - \frac{1}{I_S} \left(e^{\frac{qV_{BE}}{kT}} - 1\right) \frac{1}{V_A} \frac{dV_{OUT}}{dV_{BE}} R_C \cong -gmR_C - \frac{1}{r_o} \frac{dV_{OUT}}{dV_{BE}} R_C$$

$$A_{v} = \frac{dV_{OUT}}{dV_{BE}} \cong -gm(R_{C} \parallel r_{o})$$

## Common-Emitter Amplifier $(V_A = a finite value)^{17}$

• Small-Signal Analysis

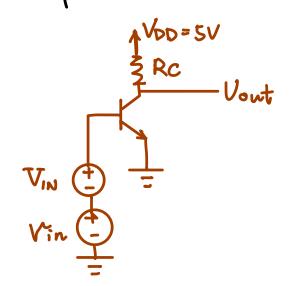

Convert to small-signed model:

DC voltage -> short to small-signal ground DC current -> open circuit

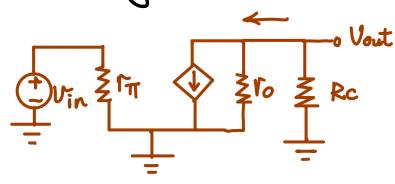

R -> still R
capacitor -> short circuit

<u>Ex</u> :

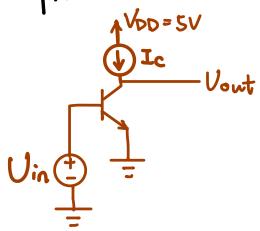

Complete circuit:

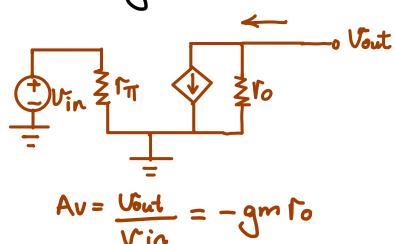

Small-signal:

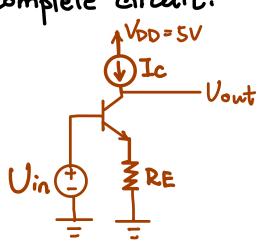

Complete circuit:

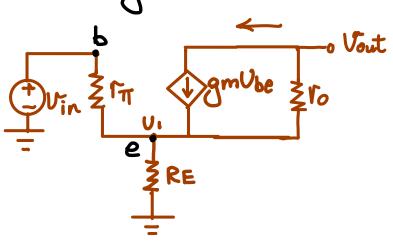

Small-signal:

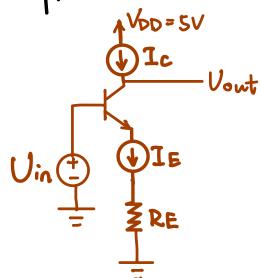

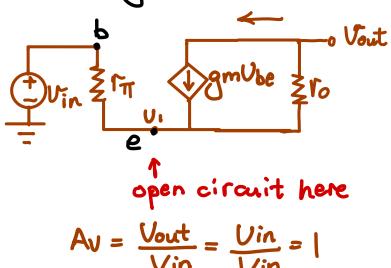

\* mind Ube used in gmUbe doesn't necessarily equals to Uin!

> Calculate Av= Vout

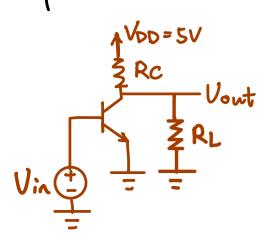

### Complete circuit:

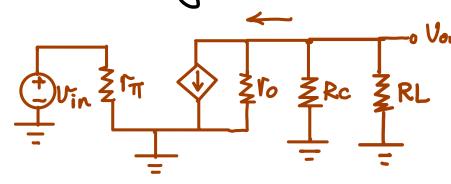

### Small-signal:

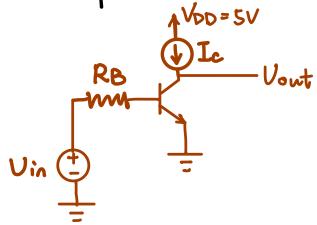

## Complete circuit:

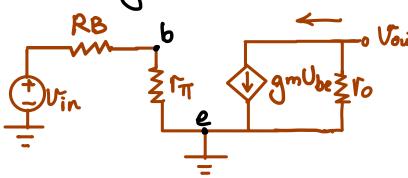

## Small-signal:

### Complete circuit:

### Small-signal:

kcl: Ube = Uin 
$$\frac{\Gamma \pi}{\Gamma \pi + RB}$$

$$Av = -gm \Gamma_0 \cdot \frac{\Gamma \pi}{\Gamma \pi + RB}$$

\* What if there's a diode connected?

A typical complete question for BJT common-emitter:

Given Uin = 0.5+0.001 sin (27760t)

Plot the waveform of Vout

(.model VAF = 100)

Vout = Vout + Av. 0.001 sin (21160t)

Step 1: Find Vour (DC part of Vout)

$$V_{OUT} = 5 - I_{C} \cdot (IK)$$

$$Plug in I_{C} = I_{S} \cdot (e^{9/(KT)} - I)(I + \frac{U_{CE}}{VA})$$

$$\Rightarrow V_{OUT} = 5 - (I \times 10^{-18}) \times (e^{\frac{0.5}{0.026}} - I)(I + \frac{V_{OUT}}{(00)}) \cdot (IK)$$

$$Solve the Eq. \Rightarrow V_{OUT} = 5V$$

$$\times Check if V_{Out} > V_{BE}$$

Step 2: Use small-signal circuit to find Av

# Step 3: find Ic, gm, ro, ril if needed in Av

$$I_{c} = I_{s} \cdot (e^{9V_{BE}} - I)(I + V_{CE})$$

plug in Vout calculated in Step 1

 $\Rightarrow I_{c} = 2.36 \times 10^{-10} \text{ A}$ 
 $\Rightarrow g_{m} = \frac{I_{c}}{kT/q} = 9.079 \times 10^{-9}$ 
 $\Rightarrow I_{o} = \frac{V_{A}}{I_{c}} = \frac{100}{I_{c}} = 4.14 \times 10^{-10} \Omega$ 
 $A_{v} = -g_{m}(\Gamma_{o}//R_{c}) = -9 \times 10^{-6}$ 

# Step 4: Combine all to obtain Vout

 $V_{out} = V_{out} + Av. o.001 sin (21160t)$   $= 5 - 9 \times 10^{-9} sin (21160t)$   $5 + 9 \times 10^{9}$   $5 - 9 \times 10^{9}$ 

### npn BJT Pspice Model

.model Qbreakn NPN IS=1e-18 BF=100 VAF=100

$$I_{C} = IS \left(e^{\frac{qV_{BE}}{kT}} - 1\right) \left(1 + \frac{V_{CE}}{VAF}\right)$$

$$BF = \frac{I_{C}}{I_{B}} \qquad I_{E} = I_{C} + I_{B}$$

$$gm \cong \frac{I_C}{kT/q} \quad r_\pi = \frac{BF}{gm} \quad r_o \cong \frac{VAF}{I_C}$$
